

Evaluation of influence of EFPAS project on school SP2 Poland

We should take care of our ecology. We kill our nature every day and this tendency must be stopped. Thanks to the many and varied EFPAS project activities students, teachers and parents awareness about how protect our nature has greatly increased. Different projects' ideas and topics for schools involved in the strategic partnership students were engaged in being "green". Teachers found this information useful to generate more ideas and use the materials produced (films, presentations, pictures, lesson plans, quizzes etc.) during partnership in their daily practice – both for a formal education and non-formal activities.

EFPAS project broadened ecological awareness among our students. Results are seen in the survey carried out by students about the influence of the project. Students pay attention to the main risk factors that negatively affect the environment :

- [Climate change](#);
- Natural catastrophes;
- Pollution of all kinds;
- Decrease of flora and fauna;
- Deforestation;
- Ineffective environmental law and policies;
- Chemical effluents;
- Technology and production

Students planted trees and then took care of them. It was a good activity to combine work and education. It was a perfect chance for teachers to teach our students how trees absorb carbon dioxide and produce oxygen. During Eco friendly food days students should brought natural and safe products. Teachers taught them about dangerous foods and products and benefits of eating healthy food products. All school community become engaged in recycling, recycling rubbish bins were introduced and students learned how to separate rubbish, and utilize it. It helped to develop the habit to throw trash where it will be recycled. Activities are implemented in the school curriculum ensure its long lasting effects on the teachers, students and parents.
